Message

I am happy to learn that the International Symposium on Frontiers in Catalysis in the 21st Century is proposed to be held on 19th and 20th January 1999 and a beautiful commemorative Souvenir is proposed to be brought out to mark the occasion.

It is also heartening to learn that the International Symposium will be attended by more than 250 delegates, both from India and abroad. I am glad that a product exhibition will also be organised on this occasion for the benefit of delegates.

I wish the above International Symposium all success.

MEESSAGE

I am happy to learn that the IIP and the Catalysis Society of India are organising an International Symposium on the occasion of the 60th birthday of Dr. T.S.R. Prasada Rao.

In his career spanning over 30 years, Dr. Prasada Rao has made significant contributions to the scientific and technological process of catalysis in various industries.

It is fitting that his contribution is recognised through this symposium. My best wishes for its success.

Message

I am very happy to know that Indian Institute of Petroleum and Catalysis Society of India jointly plan to bring out a Felicitation Souvenir in honour of Dr. T.S.R. Prasada Rao for release at the International Symposium on Frontiers in Catalysis in the 21st Century to be held at Dehra Dun during January 19-20, 1999.

Dr: Prasada Rao is a catalysis scientist of international eminence and a leading light in the development and propagation of this branch of science in India in contemporary times. He is credited with the development and commercialisation of various catalytic processes and catalysts for Petro-chemicals and fertilisers.

Catalysis is the most critical factor in most of the industrial processes, more particularly in chemical industries including petroleum, petrochemicals, fertilisers, drugs and a host of others. The role of catalysts in chemical processing will become more and more critical in future not only to achieve higher product quality levels

to meet customer expectations but also to conform to increasingly stringent environmental norms likely to come into effect.

The petroleum refining industry in India with an installed capacity of over 67 million tonnes per year is a large consumer of catalysts for fluid catalytic cracking process which are now being imported at a heavy cost. With expansion programmes in various refineries and new refineries planned, the existing capacity is slated to reach 129 million tonnes in the next-few years with catalyst requirements also going up proportionately. Therefore, it is high time for India to develop and manufacture indigenous catalysts to make our refining operations more competitive than at present. Hydrocracking process is yet another new addition to catalytic processes requiring focused attention of the scientists.

In his capacity as Director, Indian Institute of Petroleum and as Member of various technical committees, Dr. Prasada Rao has made very significant contributions to the growth, operational efficiency and safety in the oil industry. Indian Oil Corporation had the benefit of his advice on a number of technical and R&D related issues and I have very happy memories of constructive and stimulating interactions with him. I wish him more crowning achievements and the best of everything else in life.

FELICITATION MESSAGE IN HONOUR OF DR T S R PRASADA RAO

The initiative of the Catalysis Society of India and the Indian Institute of Petroleum to organize the International Symposium on 'Frontiers in Catalysis in the 21st Century' at IIP, Dehradun in honour of Dr T S R Prasada Rao on his 60th birthday is indeed, the most befitting honour that one most eminent Catalysis Scientists of India so richly deserves. It is heartening and I feel proud to be associated in the programme. In my opinion, Dr Prasada Rao, Director, IIP during his tenure has taken this 'National Institute' to greater height in the International Scientific domain. It is Shri Rao who did not leave nay stone unturned to commercialise the technologies developed by the scientists of IIP and thereby brought fame to the Institute and name to the Scientists. I personally came to know Dr Rao only after he took over the helms of this premier Institute and then had many occasions of seeing him deliberating in Scientific Technology Forums, where he had gone out of way to project the image of the Institute and its Scientists. It is Dr Rao who has taken this prestigious institution to its glorious peak in the scientific world and brought the culture of team work amongst the Scientists/Technologists of IIP.

Dr Prasada Rao, a Catalysis Scientist himself has contributed immensely to indigenise business of catalysis in this country. His emphasis on technology development and commercialisation has provided a major fillip to globalisation and marketing of Indian technology and paved the way in establishing technology alliance with the world renowned technology establishments like IFP, UOP, SWEC, Mobil etc. This will go a long way in projecting the Indian technologies abroad.

His efforts in commercialisation of reforming catalyst, xylene isomerisation catalyst, NMP extraction process are few of the innumerable examples of his contribution in the field in the country. He took personal interest and saw that the commercialised technology succeeded in Indian Industries.

I take this opportunity to felicitate him and wish him all the best of life on his 60th birthday. I shall be looking forward to many more contribution from him for the development of science and technology for this nation in the days to come.

P K Biswas
Executive Director
Mathura Refinery

*INTERNATIONAL SYMPOSIUM ON
FRONTIERS IN CATALYSIS IN THE 21st CENTURY*
(In honour of Dr T S R Prasada Rao)

PROGRAM

JANUARY 19, 1999

INAUGURAL SESSION

9.30 – 11.00 hrs

Inauguration by

Professor C N R Rao, FRS

President

Jawaharlal Nehru Centre for Advanced Scientific Research,
Bangalore, India

Presided by

Dr R A Mashelkar, FRS

Director – General, CSIR & Secretary, DSIR, India

10.15 – 11.00

Keynote Address by the Chief Guest

Professor C N R Rao, FRS

Jawaharlal Nehru Centre for Advanced Scientific Research,
Bangalore, India

11.00 – 11.30 hrs

Tea Break

SESSION – II

:

INNOVATIVE APPROACHES IN CATALYSIS

11.30 – 13.00 hrs

INVITED LECTURES (2)

11.30 – 12.15

How to Speed up the Development of Optimized Catalysts

Professor Michel Boudart

Department of Chemical Engineering

Stanford University and University of California at Berkeley, USA

12.15 – 13.00

Catalysis in Renewable and Non-traditional Energetics

Professor Valentin N Parmon

Boreskov Institute of Catalysis, Novosibirsk, Russia

13.00 – 14.00 hrs

Lunch Break (IIP Campus)

PROGRAM

JANUARY 19, 1999

SESSION – III : CATALYSIS AS AN INNOVATIVE TECHNOLOGICAL FRONTIER

14.00 – 15.30 hrs INVITED LECTURES (2)

14.00 – 14.45 Sustainable and Innovative Catalytic Technologies
Dr Ian E Maxwell
Shell Research & Technology Center, The Netherlands

14.45 – 15.30 New Scientific and Technological Frontiers in
Diesel Fuel Formulation
Dr Henrik Topsoe
Haldor Topsoe A/S, Denmark

15.30 – 15.45 hrs Tea Break

SESSION – IV : CATALYSIS IN NATURAL GAS/SYNGAS CONVERSION

15.45 – 17.15 hrs INVITED LECTURES (2)

15.45 – 16.30 Feedstocks for Petroleum and Petrochemicals from Novel Methan
Natural gas Conversion Processes
Dr Vasant R Choudhary
National Chemical Laboratory, Pune, India

16.30 – 17.15 Modified F–T Synthesis for Selective Production of
C₄ Hydrocarbons using Various Solid Acid Catalysts in
Dual Reaction Systems
Professor A K Dalai
University of Saskatchewan, Canada

18.30 – 19.30 hrs CULTURAL PROGRAM – AT IIP AUDITORIUM
KUCHIPUDI DANCE PERFORMANCE by
Padmasri Raja Reddy & Radha Reddy Couple

20.00 – 21.30 hrs Dinner (Hotel Madhuban)

JANUARY 20, 1999

FELICITATION FUNCTION

9.30 – 11.30

Felicitation of Dr T S R Prasada Rao on his 60th birthday

11.30 – 12.00 hrs

Tea

SESSION – V

:

NEW DEVELOPMENTS IN CATALYST DESIGN

12.00 – 13.30 hrs

INVITED LECTURES (2)

12.00 - 12.45

Latest Trends in MCM type Mesoporous Materials and their Novel Applications

Dr Girish K Chitnis

Mobil Technology Company, USA

12.45 – 13.30

Design and Development of Pore Size Regulated Zeolite Catalyst for Selective Synthesis of para-Dialkylbenzenes

Dr Anand B Halgeri

R & D Centre, Indian Petrochemicals Corp. Limited, India

13.30 – 14.30 hrs

Lunch Break (IIP Campus)

SESSION – VI

:

RESEARCH IN OXIDATION CATALYSIS – PRESENT STATUS

14.30 – 16.00 hrs

INVITED LECTURES (2)

14.30 -15.15

Mild Oxidation of Alkanes for Obtaining Valuable Chemicals : The Present Status of Research

Dr Jean - Claude Volta

CNRS, France

15.15 – 16.00

Activity and Selectivity of Promoted MgO and CaO Catalysts for Oxidative Coupling of Methane

Professor Dr Radmila Marinkovic - Neducin

University of Novi Sad, Yugoslavia

16.00 – 16.15 hrs

Tea Break

JANUARY 20, 1999

SESSION – VII : APPLICATION OF HOMOGENEOUS CATALYSIS

16.15 – 16.30 hrs INVITED LECTURE (1)

16.15 – 16.30 Olefins Transformation by Homogeneous Catalysis –
the IFP Experience
Dr Alain Forestiere
Homogeneous Catalysis Division, IFP, France

16.30 – 17.00 Concluding Remarks & Vote of Thanks

19.30 – 21.30 hrs Dinner (Hotel Madhuban)

HOW TO SPEED UP THE DEVELOPMENT OF OPTIMIZED CATALYSTS

M. Boudart

**Department of Chemical Engineering
Stanford University and University of California, Berkeley
USA**

The first, largest and fastest development of a new catalyst was carried out at BASF in a crash program to synthesize ammonia. This program was started in 1909 by Mittasch, who defined and realized what is currently called combinatorial catalytic chemistry (CCC). The implementation of CCC relies on making and testing large collections of multicomponent catalysts. This is what the program of Mittasch did, but today that process is assisted by microfabrication techniques derived from the semiconductor industry.

Another promising methodology relies on a microkinetic analysis (MKA) of the catalytic process. It consists of repeated loops of catalyst synthesis, characterizing, and testing. At the end of each loop an attempt is made to analyze the results by means of a set of rate constants of presumed elementary steps. At the beginning of each new loop, a corrected catalyst composition is tested. A growing kinetic data bank is built up as the catalyst improves in the iterative process. Ideally, the CCC technique and the MKA technique can be combined to speed up catalyst development and optimization in a systematic and quantitative mode of assisted catalyst design. When this ultimate goal will be reached can only be speculated upon. As to the discovery of new catalyst reactions and new catalysts, this will be left to experts on the subject of creativity.

CATALYSIS IN RENEWABLE AND NONTRADITIONAL ENERGETICS*V.N. Parmon***Boreskov Institute of Catalysis
Novosibirsk 630090
RUSSIA**

The real far future of our civilization depends mostly on our ability to resolve the expected energy problems. In case of absence some rigid limitations on the amount of energy in the mankind's disposal there will be no danger of a shortage of food, artificial motor fuel and chemicals, etc. even for a 10 billion population of Earth [1].

There are two evident ways to overcome the future energy problems. First of all, one should increase the efficiency of usage of conventional energy carriers, that means simultaneously a necessity to diminish drastically the wastes or losses of energy. The second way is to enlarge utilization of non-exhaustible sources of energy which still do not create the basis of the now-a-days energetics. The principal role in all these movements belongs to catalytic technologies.

Traditional way in application of catalytic technologies energetics is their use for improvement of incineration of conventional or available fuels in various large or small-scale power plants. This allows to increase the heat-producing efficiency of these plants as well as to diminish pollution of the environment by toxic products of the fuel combustion. However, there are also some not so evident applications of catalytic technologies which may appear to be of a principal interest for the future.

This presentation concerns the modern trends in application of catalytic technologies to (i) producing heat or high quality liquid fuels from renewable sources of carbon-containing raw materials (primarily biomass); (ii) utilizing nuclear and nontraditional sources of energy, (iii) producing the mechanical or electrical energy from the energy of chemical energy carriers, and (iv) recovering middle or low potential heat wastes or utilizing some unexpected heat-energy sources (see also [2]).

SUSTAINABLE AND INNOVATIVE CATALYTIC TECHNOLOGIES

Ian E. Maxwell

**Shell Research and Technology Center
P.O. Box 38000, 1030 Amsterdam
The Netherlands**

Catalysis plays an important role in the development of environmentally sustainable technologies which span across many important industries such as oil refining, petrochemicals, fine chemicals, transportation, power generation and natural gas conversion. In fact, recent studies sponsored by various governments have shown that catalytic technologies account for some 20-30% of national GDP for many countries where catalysis plays a key role in a wide variety of processes and products. In global terms this amounts to some US\$ 5-7.5 trillion per annum in terms of economic importance. Some examples of recent innovations and developments in the field of catalytic technologies will be described where there is a strong link to environmental sustainability.

In oil refining the global trend towards "cleaner" fuels continues to result in governmental legislation relating to sulphur levels in gasoline and diesel fuels. In turn, this has stimulated research on improved hydrodesulphurization catalysts where there have been incremental improvements in performance over a number of years. In addition, new combinations of catalytic and reactor technologies, such as 2-stage, single stage counter current stacked bed reactor configurations and catalytic distillation technologies have been developed for more efficient and cost effective deep hydrogenation and HDS of diesel fuels. These new technologies also enable more powerful catalyst systems based on zeolites and noble metals to be deployed in combination with conventional mixed sulphide based catalysts.

Air pollution legislation related to NO_x emissions is also becoming more stringent and is penetrating globally and thereby stimulating further improvement of selective catalytic reduction technologies. Some recent developments include the application of lateral flow reactor designs and alternative catalysts which can, in principle, achieve higher catalyst effectiveness factors and therefore reduced capital and operating costs compared to conventional monolith systems for certain applications. Other new developments include novel high temperature catalysts based on zeolites and more recently catalyst systems that employ hydrocarbons rather than ammonia as the reducing agent.

Catalytic exhaust emission control is gradually moving from first generation three-way catalysts towards second generation systems for both cold start applications, lean burn gasoline and diesel motor transportation vehicles. The reduction of NO_x emissions under lean burn conditions has posed a major challenge. Some novel technologies involving a combination of adsorption and catalysis have been developed in Japan to solve this problem for application in lean burn gasoline engines.

The catalytic production of liquid products from natural gas (Gas to Liquid Technologies) is currently attracting considerable attention. This interest is driven by a number of factors such as increasing proven natural gas reserves, environmental concerns related to the flaring of associated gas at oil fields and various national governments desiring to exploit remote natural gas fields.

A number of companies and consortia such as Shell, Exxon, Sasol and Syntroleum have been developing improved GTL technologies to more cost effectively convert natural gas into more valuable chemical and fuel liquid products. All these technologies involve converting methane into synthesis gas and subsequent further conversion into liquid products by means of Fischer-Tropsch (F-T) catalysis. In fact, Shell has already had a plant operating at Bintulu in Malaysia for a number of years which deploys this type of technology and produces both chemicals and "clean" fuel products. Current research in this field is focused on reducing the capital cost of both the synthesis gas manufacturing and the catalytic F-T step by developing improved catalysts and reactor technologies.

In the chemicals industry catalytic technologies continue to contribute strongly to reduce undesired by-products and minimizing waste streams. Oxidation catalysis is important in this respect with new zeolite based catalyst systems emerging which employ aqueous hydrogen peroxide and nitrous oxide as oxidants. Some 90% of new chemical processes are now catalytic and the applications which have been traditionally wide spread in the bulk petrochemicals industry are now also gaining ground in the fine chemicals and even pharmaceuticals areas.

Finally, the emergence of some innovative enabling technologies for application in catalysis such as robotics synthesis and high speed screening techniques is also important and has the potential to significantly accelerate the innovation step in the search for new and improved catalyst systems.

NEW SCIENTIFIC AND TECHNOLOGICAL FRONTIERS IN DIESEL FUEL FORMULATION

Henrik Topsoe

**Haldor Topsoe Research Laboratories
DK-2800 Lyngby, DENMARK**

The renewed interest in hydrodesulfurization (HDS) of oil fractions is related to the increased demand to convert heavier and more sulfur-rich feed stocks and to the environmental pressures to continuously reduce the sulfur content in the oil products. For example, in several places including Europe, there are plans to lower the maximum sulfur content in diesel to the 50-100 ppm level. Consequently, there is a need for introducing so-called deep HDS which will place demands on more active catalysts and improved processing schemes. In order to aid the development of new HDS catalysts for deep HDS, it is desirable to establish fundamental relationships between the structure of the catalyst and the catalytic activity. In connection with deep HDS it is especially important to understand the reactivity and reaction pathways of the least reactive sulfur-containing molecules such as the sterically hindered dibenzothiophenes. In recent years, several useful structure-activity relationships have been established for both transition metal sulfides and promoted Mo- or W-based catalysts. The talk will discuss the activity correlations and their relevance to the situation encountered during deep HDS. The talk will also discuss some very recent *ab initio* DFT calculations of both MoS₂, Co-Mo-S, Ni-Mo-S, and Fe-Mo-S structures. These results have provided evidence for new structural features and surface reconstructions which must be taken into account when trying to understand deep HDS.

FEED STOCKS FOR PETROLEUM AND PETROCHEMICALS FROM NOVEL METHANE/NATURAL GAS CONVERSION PROCESSES

Vasant R. Choudhary

Chemical Engineering Division
National Chemical Laboratory, Pune - 411 008
INDIA

World reserves of natural gas are almost equivalent to that of oil, and more natural gas is being discovered than oil. Uncertain and/or short supply of conventional oil in the future has necessitated the use of natural gas as a source of feed stocks (viz. syngas, hydrogen, C₂-C₄ olefins, and aromatics) for petroleum and petrochemicals. Worldwide efforts are therefore being made for developing novel and/or energy efficient process for converting methane/natural gas into hydrogen, syngas, C₂-C₄ olefins, and aromatics by

- Oxidative conversion of methane to syngas
- Simultaneous exothermic oxidative conversion and endothermic steam and/or CO₂ reforming of methane to syngas
- Oxidative coupling of methane to C₂- hydrocarbons
- Oxidative pyrolysis of natural gas to ethylene and other lower olefins
- Oxycracking and oxidative dehydrogenation of ethane and propane to ethylene and propylene
- Two step conversion of methane and natural gas into aromatics or gasoline
- Direct aromatization of natural gas
- Aromatization of lower alkanes (C₂-C₄) and natural gas liquids (NGL).
- Pd-membrane assisted production of H₂ from methane/natural gas
- H₂ from decomposition of methane (by cyclic operation)

A brief account on the above, particularly with reference to our R&D activities in NCL, will be presented.

MODIFIED FISCHER-TROPSCH SYNTHESIS FOR THE SELECTIVE PRODUCTION OF C₄ HYDROCARBONS USING VARIOUS SOLID ACID CATALYSTS IN A DUAL REACTION SYSTEM

*A.K. Dalai, S.P.R. Katikaneni, R.O. Idem, R. Sethuraman,
R.V. Malyala, and N.N. Bakshi*

**Catalysis and Chemical Reaction Engineering Laboratory
Department of Chemical Engineering
University of Saskatchewan, Saskatoon
SK, S7N5C9 CANADA**

Branched C₄ hydrocarbons, namely, isobutane and isobutylene are used for many industrial applications such as in the manufacture of reformulated gasoline and in alkylation processes. Currently, these hydrocarbons are produced in petroleum sources. They may be also obtained using modified Fischer-Tropsch (FT) synthesis process. Our earlier studies have shown that C₄ hydrocarbons can be selectively produced from syngas using a combination of Co-Ni/ZrO₂ (FT) and solid acid catalysts (SO₄²⁻/ZrO₂, SO₄²⁻/TiO₂ and Pt-HZSM5) in a single fixed-bed reactor.

This study attempts to improve the selectivity for C₄ hydrocarbons using the above mentioned catalysts in two fixed-bed micro reactors in series. The first reactor contained Co-Ni/ZrO₂ catalyst while the second reactor contained the solid acid modifier catalyst (SO₄²⁻/ZrO₂, SO₄²⁻/TiO₂ and Pt-HZSM5). In all these tests, the FT catalyst was maintained at the same operating conditions (250°C, 1 atm and 15 hr⁻¹ WHSV) and the temperature of the second reactor was varied from 100° to 300°C. The FT/solid acid catalyst mass ratios were 1:0.5, 1:1, 1:1.5, and 1:2. Since the solid acid catalysts do not require reduction the second reactor was bypassed during reduction. The performances of these three solid acid catalysts were compared and explained on the characteristics of these catalysts.

Results reported earlier using Co-Ni/ZrO₂ FT catalyst alone in the reactor indicated an optimum C₄ hydrocarbon selectivity of 13 wt % could be obtained at a reduction temperature of 400°C, reaction temperature of 250°C, reactor pressure 1 atm, and 15 hr⁻¹ WHSV. This study showed that there was tremendous increase in the C₄ hydrocarbon selectivity when the SO₄²⁻/ZrO₂ catalyst was incorporated in the second reactor. The maximum selectivity to C₄ hydrocarbons was increased to 31 wt %, at temperature of 150°C in the second reactor, 1 atm pressure and 15 hr⁻¹ WHSV using a FT/solid acid catalyst mass ratio of 1:1. In the case of the SO₄²⁻/TiO₂ catalyst, the maximum C₄ hydrocarbon selectivity obtained was 19 wt %, at a temperature of 200°C in the second reactor, 1 atm pressure, and 15 hr⁻¹ WHSV with FT/solid acid catalyst mass ratio of 1:1.5. On the other hand, the maximum C₄ hydrocarbons selectivity using Pt-HZSM5 was 28 wt %, at a temperature of 250°C in the second reactor, 1 atm pressure and 15hr⁻¹ WHSV using FT/solid acid mass ratio 1:1.

LATEST TRENDS IN MCM TYPE MESOPOROUS MATERIALS AND THEIR NOVEL APPLICATIONS

Girish K. Chitnis

**Mobil Technology Company
USA**

There has been an explosive growth in research in MCM type of mesoporous materials since their discovery by Mobil in 1991. The M41S family of materials allow tailoring of both structure and well defined pore sizes over a wide, 50-500Å range.

The discrete & well ordered mesopores and potential for custom functionalization of pore walls offer exciting opportunities to develop new applications. Several such applications are reviewed. In particular, the use of MCM-41 for toxic metals removal (mercury, arsenic, etc.) from drinking water as well as industrial waste water is illustrated.

DESIGN AND DEVELOPMENT OF PORE SIZE REGULATED ZEOLITE CATALYST FOR SELECTIVE SYNTHESIS OF PARA-DIALKYL BENZENES

A.B. Halgeri and J. Das

Research Centre
Indian Petrochemicals Corporation Limited
Baroda - 391 346
INDIA

In recent times the need to protect environment has induced chemical industry to develop new, highly selective zeolite catalysts which yield purer products and avoid side reactions leading to the formation of undesired and very often toxic byproducts. The present work aims in this direction.

Shape selective alkylation of alkylbenzenes over MFI Zeolites is of great industrial importance owing to the formation of very useful para substituted dialkylbenzenes like para-xylene, para-diethylbenzene, para-ethyltoluene and para-cymene. It has been reported earlier that only near equilibrium mixtures of dialkylbenzenes with unmodified zeolites. However, the para-isomer can be enhanced beyond equilibrium compositions by modifying the structure of zeolite. One of the recently developed techniques to achieve high para selectivity is to modify the zeolite by chemical vapour deposition of silica known as CVD technique. This involves blocking of non-selective external surface and pore mouth sites without altering the internal zeolite structure. In this report in this study various alkylation reactions of industrial importance including disproportionation of toluene and aromatisation of paraffins over pore size regulated zeolite catalyst to produce selectively para-dialkylbenzenes. The design of zeolite catalysts through pore size modification by silica deposition and its effect on shape selectivity enhancement during mono alkylbenzene alkylation with C₁-C₃ alcohols have been studied. The alkylation reactions included in the study are toluene methylation, toluene ethylation, toluene isopropylation and ethylbenzene ethylation.

The MFI zeolite used in this work was synthesised as per the reported literature. It was characterised by XRD, SEM, MAS NMR and TPD of ammonia. The catalytic runs were carried out in a fixed bed, continuous down flow integral reactor at atmospheric pressure. The chemical vapour deposition of silica was done in situ with tetraethyl ortho silicate. The large crystal MFI zeolite above 5-7 μ m showed shape selectivity effects and was selected for further studies. The para selectivity of MFI zeolite was achieved by pore opening size regulation. This was achieved by depositing vapour of bulky silicon compound whose molecular size is larger than zeolite pore opening. The internal structure of the zeolite remained unaffected, only the pore opening size was reduced.

On the pore size regulated MFI zeolite, during the alkylation reactions, the alkylbenzene conversion was more for ethylation than methylation. Para-dialkylbenzene selectivities were 100 %, 95 %, 93 % and 88 % respectively for para-cymene, para-diethylbenzene, para-ethyl toluene and para-xylene. This is in order of dialkylbenzenes where in turn is related to diffusivity difference between para- and other isomers. In addition to alkylation reactions, selective disproportionation of toluene and aromatisation of paraffins over pore size regulated Ga₂O₃ incorporated zeolite were also studied to produce selectively para-xylenes. The results showed that the content of p-xylene was enhanced in the range of 80 to 90% in xylene fraction as against 24% over unmodified zeolites. The influence of reaction parameters such as temperature, WHSV, mol ratio of mono alkylbenzene to alcohol on the para-dialkylbenzene selectivity and stability have been discussed.

The above technique of enhancing para selectivity has been successfully employed to develop a commercial process for manufacturing a value added chemical para-diethylbenzene from alkylation of ethylbenzene with ethanol. The composite modified zeolite catalyst exhibited a steady state activity of 8-10 % ethylbenzene conversion with 97-98% selectivity towards para-diethylbenzene across a single bed. The process is ecofriendly and does not involve any corrosive or pollutive chemicals. The pore size regulated zeolite catalyst has very high stability and is regenerable. The process selectively produces p-DEB and a simple distillation is sufficient to separate the desired product, thereby eliminating complicated separation process. The lecture highlights some of the unique advantages of pore size regulated zeolites for the selective synthesis of para-dialkyl benzenes over conventional acid catalyzed reactions.

MILD OXIDATION OF ALKANES FOR OBTAINING VALUABLE CHEMICALS : THE PRESENT STATE OF RESEARCH

Jean - Claude Volta

**Institut De Recherches Sur La Catalyse -
Centre National De La Recherche Scientifique
2 Avenue Albert Einstein, 69626, Villeurbanne Cedex
FRANCE**

The selective oxidation of alkanes is an important field of research for the further 20 years. This appears to be one of the conclusions of the workshop of the American Chemical Society (Washington, March 20-21, 1997). Indeed due to the low cost of raw material, there is a high potentiality for research in that field.

Very important industrial chemicals like acetic and acrylic acids, or maleic and phthalic anhydrides, may be obtained by direct oxidation of light alkanes such as ethane and propane, or n-butane and n-pentane at relatively low temperature (275-430°C). The difficulty for such a catalysis is due to the higher reactivity of the molecular olefinic or oxygenated intermediates which are more reactive than the starting alkanes molecules.

The strong development of research in alkane oxidation to be expected in the future will be a consequence of the results obtained with the study of the oxidation of n-butane to maleic anhydride on vanadium phosphorus oxides (VPO) catalysts. In the last five years, a large number of informations have been obtained on the VPO catalyst due to the development of new routes of preparation of the catalyst precursor and also to the possibility to approach the atomic structure of the materials when crossing complementary physicochemical techniques such as X-ray diffraction, XPS spectroscopy, Raman spectroscopy (in-situ), ^{31}P and ^{51}V solid NMR, High Resolution Electron Microscopy and Electron Conductivity. These techniques give informations on the volume and the surface of the VPO catalysts for which informations are necessary.

For n-butane oxidation at 380-400°C, the VPO catalyst is constituted of a $(\text{VO})_2\text{P}_2\text{O}_7$ matrix highly developing the (100) crystal face with a suitable number of V^{5+} species in a special environment. The catalytic performances to maleic anhydride production are controlled by the dispersion of the V^{5+} species which depend on the preparation of the $\text{VOHPO}_4 \cdot 0.5 \text{H}_2\text{O}$ precursor (different routes of preparation have been developed to control this aspect), but also by the conditions of activation of the catalyst which control the $\text{V}^{5+}/\text{V}^{4+}$ ratio and the defects in the bulk material. A way to change the chemistry of the catalyst is to dope the VPO catalyst by different elements which modify both the redox and the acido-basic properties of the catalyst.

For n-propane oxidation to acrylic acid at 430-400°C, the $(\text{VO})_2\text{P}_2\text{O}_7$ matrix has to be more oxidized to activate the propane molecule (higher $\text{V}^{5+}/\text{V}^{4+}$ ratio), but water has to be added to the C_3/air flow in order to improve the acidity (both Brönsted and Lewis sites) to produce acrylic acid. The technical problems associated to acrylic acid (high facility of polymerisation) as compared to maleic anhydride (more stable) makes this research much more difficult.

For ethane oxidation to acetic acid at 275°C, the VPO catalyst has to be modified; it is necessary to disperse molybdenum and vanadium phosphates on a TiO_2 support at a low coverage (less than one monolayer). In reducing conditions, at low contact time and under pressure (7 bars), with addition of water in the flow, acetic acid is obtained at 2% conversion of ethane with a selectivity of 35%. A correlation has been established between the acidity of the surface (Brönsted sites) and the acetic acid yield which is increased by the influence, at short distance, of molybdenum on the vanadium sites.

For n-pentane oxidation to maleic and phthalic anhydrides, at 300-340°C, it is not yet understood what parameters influence the phthalic anhydride/maleic anhydride ratio.

ACTIVITY AND SELECTIVITY OF PROMOTED MgO AND CaO CATALYSTS FOR OXIDATIVE COUPLING OF METHANE

Erne E. Kiš, Radmila P. Marinković-Nedušin and Goran C. Bošković

Faculty of Technology, University of Novi Sad
21000 Novi Sad, Bul. Carra Lazara 1
YUGOSLAVIA

Oxidative coupling of methane (OCM) is one in the category of promising processes in valorization of natural gas. Proven oil reserves are slowly eroding, while gas reserves continue to grow rapidly, which contribute to increased global interest in new emerging technologies for efficient conversion of natural gas into higher value products. Development of direct processes as OCM and methane homologation (MH), avoiding the stage of energy intensive synthesis gas production, are of especial economic interest.

Since the early work of Keller, Bhasin and Hinsen at the beginning of eighties, the extensive work in the field of OCM precedes, based on thermodynamical and kinetical consideration of the reaction catalytic aspects concerning activity, selectivity and stability of different catalyst types, and also process aspects. Based on comprehensive consideration of the published results in these broad fields the paper is especially concerned with catalytic properties of different oxide catalysts as one of the basic factors to move the process from laboratory closer to industrial level.

The results of activity, selectivity and stability of alkali earth metal oxide catalysts promoted by alkali metals will be presented. Catalysts like MgO and CaO of different prehistory were doped by K of various origin in order to enlighten both the critical factor influencing each of the catalytic properties and the mechanism of promoting effect. Generally observed promoting effect of K on activity and selectivity is strongly influenced by the precursor, the type of introduced anion, especially towards selectivity. Prehistory of the catalyst determines its initial catalytic behaviour, but the leveling effect is observed once the promoter is added, indicating the complex interactions in the system. The stability of the catalyst in applied reaction conditions is suspected to be still the most critical for efficiency of the process.

The preferences and obstacles of OCM process at the present stage of development are compared with those of another potential future process aimed to higher hydrocarbon production, i.e. methane homologation. Promoter effects in those different systems extended to different mechanisms are under consideration in one and two-stage processes were focused. Comparisons were made based on catalytic behaviour as well as on structural characteristics of different OCM and MH catalysts.

OLEFIN TRANSFORMATION BY HOMOGENEOUS CATALYSIS : THE IFP EXPERIENCE

A. Forestiere and H. Steinmetz

**Institut Francais Du Petrole
1et 4 avenue de Bois-Pereau
92852 Rucil Malmaison Cedex
FRANCE**

Homogeneous catalysis probably dates to the 1930's with the discovery of the catalytic properties of metal carbonyl complexes. In 1938, Roelen discovered that cobalt complexes catalyzed the olefin hydroformylation reactions, which is one of the most important processes involving homogeneous catalysis. Later, in 1953, Ziegler and Natta marked a new epoch when they demonstrated the efficiency of titanium complexes associated with alkyl-aluminium compounds for the promotion of ethylene and propylene polymerization. Innovation in homogeneous catalysts entered a new era with the discovery of the excellent activities and selectivities afforded by tailor made metallocene complexes associated with alkylaluminumoxydes for polymerization reactions.

During the late 1950's, Total Petroleum discovered an industrial LPG and gasoline sweetening process based on soluble cobalt phthalocyanine complexes. It was the first application of homogeneous catalysis inside a petroleum refinery. The IFP Dimersol™ process, developed and commercialized at the end of the 1970's, is another of the rare examples of a homogeneous process involved in the refining industry. Dimersol™ employs a soluble nickel complex and a chloroalkylaluminium compound (a Ziegler type catalytic system) to oligomerize light olefins in the liquid phase.

Today, there are numerous industrial processes involving homogeneous catalysis. These systems find their principal application in the production of large scale chemical intermediates and in fine chemistry. Homogeneous catalysis is generally poorly represented in the refining industry.

IFP continues to be strongly active in this field, particularly in the development of processes involving olefin transformation. The chemistry, process description, industrial performance and economics of the commercially successful Dimersol™ family of processes, based on the use of nickel complexes, will be detailed, including :

- Dimersol-E, which produces gasoline from FCC ethylene and propylene,
- Dimersol-G which makes hexenes by propylene dimerization.
- Dimersol-X, a key process for the production of octenes for plasticizers by butenes dimerization.

IFP has also extended the application of our homogeneous catalysis knowledge into the field of petrochemicals. Twenty Alphabutol™ processes have been licensed to produce over 300,000 tons per year of high purity 1-butene from the selective dimerization of ethylene catalyzed by a titanium based complex. Our innovation in this field continues with the newly announced AlphaSelect™ process for the production of higher alpha-olefins by ethylene oligomerization. AlphaSelect™ enables an optimization of the production of C₄ to C₁₀ alpha-olefins from ethylene by employing a zirconium complex. These alpha-olefins are key components for the production of special quality polyethylene.

The latest in the line of IFP homogeneous catalyst based process innovations is the Difasol™ process. In conjunction with Dimersol-X, used as a finishing step Difasol™ ensures a significant boost in octenes yield with a reduction in catalyst consumption. The dimerization reaction is achieved thanks to a nickel complex dissolved in an ionic medium which is a molten salt. Both the AlphaSelect™ and the Difasol™ processes will be discussed.

Dr. T.S.R. PRASADA RAO – A PROFILE

*Prof. Chunshan Song**

It gives me a special pleasure to write this article for the Felicitation Volume in honor of Dr. T. S. R. Prasada Rao on the occasion of his 60th birthday. I have had close interactions with Dr. Prasada Rao in the past several years. Personally, I have high respect for Indian catalysis community, and quite a few young researchers from India have worked with me in our laboratory. I first met Dr. Prasada Rao at the International Catalysis Congress in Baltimore in 1996 by the introduction of one of my coworkers, Dr. K. Madhusudan Reddy who completed his PhD research in National Chemical Laboratory in Pune under Dr. S. Sivasanker and Dr. Paul Ratanasamy. Dr. Prasada Rao kindly invited me to present an invited lecture at the Indian Catalysis Society National Meeting in Dehra Dun in 1997. I accepted the invitation, but due to the delay in receiving the invitation and the short time in making the travel arrangements within our busy schedule, we were not able to make the trip although I did contribute a review paper to the proceedings. He called me several times, which deeply moved me, and in a long phone conversation, he made me to promise that I will attend the next meeting in Madras in 1998. Later during his trip to US, he accepted our invitation to visit our laboratory at the Pennsylvania State University in March 1998, and gave an inspiring lecture on the development of catalytic processes. Most recently I visited India by kind invitation from Prof. V. Murugesan and Dr. Prasada Rao for giving a plenary lecture at the 14th Indian Catalysis Society National Meeting in Anna University in Madras during December 16-18, 1998. In this trip I also had opportunities to visit National Chemical Laboratory in Pune (hosted by Dr. Paul Ratanasamy and Dr. A. V. Ramaswamy), Indian Institute of Petroleum in Dehra Dun (hosted by Dr. T. S. R. Prasada Rao and Dr. Murali Dhar), and Research Center of Indian Oil Corporation (hosted by Dr. R. P. Verma and Dr. Sobhan Ghosh). I enjoyed the meeting and discussions during the catalysis symposium and during my visits to the laboratories of the leading researchers at the above-mentioned organizations. Through this trip I developed a deeper appreciation for Dr. Prasada Rao's leadership and I am proud to have known Dr. Prasada Rao as a professional colleague and a close friend.

A brief discussion is due here on leadership since I characterized him as a highly successful leader. In plain words, leadership determines what are the right things to do, and management skills concern how to do the things right. What distinguishes an effective leader in a research organization from an effective researcher? Having worked in industrial R&D center and in academia and interacted professional colleagues worldwide for sometime, I would like to share my own perspectives. Many scientists prefer to become an accomplished researcher in terms of quality and productivity of his or her own research or their research group, but this often more or less independent nature of research process could make the effective management of a large organization a little more difficult. In some cases where the mental environments are not so ideal, researchers and workers in different groups may not be very cooperative with each other. This can create a different mind set in people that could jeopardize the whole organization in long run. In my opinion, an effective and dynamic leader in a large research institute should possess first of all the right vision for the future, the clear mission for the organization, good interpersonal skills with sincere respect for the people, the ability to create new initiatives and to delegate responsibilities, the capacity to understand different views and concerns by the people at the working level, the skills to solve problems in a timely manner, the ability to shift the paradigm of thinking by the people in the organization to a cooperative and productive regime, and the capability to interact effectively with key personnel in government agencies, industries, national laboratories, universities and professional organizations. To be effective in understanding the concerns of the scientists and the key challenges in research and development, the leader should have extensive experience and track record as a successful researcher.

Dr. Prasada Rao has what it takes to be a highly successful and dynamic leader, and has proved his strong leadership in leading IIP to become a major institution with nation-wide and worldwide recognition. After my recent visit, I have no doubt that most people in Indian

* *Director, Applied Catalysis in Energy Laboratory and Department of Energy & Geo-Environmental Engineering, The Pennsylvania State University, 209 Academic Projects Building, University Park, PA 16802 USA*

Institute of Petroleum would agree with me on this view. I myself have learnt a lot from discussions with him, particularly during our recent trip together from Delhi to Dehra Dun by car. He told me that he cared most about people and explained to me how he evaluated the situations when he first moved to IIP in 1990, how he interacted with people, what he did to change the work environment and to motivate the employees, how he built the cooperative relations with refining industries, and how he and his associates transformed IIP and what is he is continuing to do to make IIP into a global presence. Each of these was very challenging at the time, and he did all this with his associates and apparently he enjoys what he does. It was intellectually enriching to see his leadership, managerial skills, technical and the personal aspects that are all consistent with an underlying philosophy in life. At this point it is appropriate to mention his career development. He was born on January 20, 1939 in Southern India. He completed his educational training (Bachelor, Master and PhD) from the Andhra University in 1967 and then joined Projects and Development India Limited, Sindri, where he worked on temperature-shift fertilizer catalysts. In 1974 Dr. Prasada Rao moved to the Research and Development Center of India's first petrochemical company, the Indian Petrochemical Corporation Limited (IPCL) in Baroda. He worked on catalysis for petrochemical and refining technology at IPCL and was also responsible for the entry of IPCL into the global business of catalyst manufacture. At IPCL Dr. Prasada Rao is best known for developing the xylene isomerization catalyst "Encilite" in collaboration with researchers at the National Chemical Laboratory in Pune. Additionally, at IPCL, Dr. Prasada Rao was intimately associated with building and managing a first-class research facility in catalysis, adsorbents and polymers. In 1990 the Government of India persuaded Dr. Prasada Rao to move as Director of the Indian Institute of Petroleum (IIP) in Dehra Dun.

Several senior and junior researchers at IIP told me that this institute was not a well-recognized one in India and the Indian refining industries did not have much tie with it in the late 1980s. However, there have been dramatic changes after Dr. Prasada Rao was appointed to the Director of IIP in 1990. Since then, Dr. Prasada Rao and his associates have

transformed IIP into India's premier refining technology center with a global presence. This is reflected by the facts that IIP has forged alliances with almost the entire Indian refining industry as well as Amoco, Mobil, UOP, Stone and Webster, Unitel Technologies, Dorf Ketal, HTI, ABB Lummus, and Praxair. At IIP he has been involved with initiating and monitoring new research and development initiatives at IIP including liquid phase oxidations, zeolite catalysis, separation processes and refining technology. What I was most impressed with was that under his leadership, mostly the same employees have made great strides in the same IIP in the past eight years. He remembers the names of the 600 employees in IIP as well as his family members. In addition to the institute-wide achievements, the notable scientific contributions by Dr. Prasada Rao's own research group at IIP include development of a single-step adipic acid synthesis process and the Naphtha to Gas and Gasoline (NTGG) process. I have seen from the display at IIP during my recent visit that IIP has won CSIR Technology Award 7 times under Dr. Prasada Rao's leadership with the most recent one awarded in 1998.

During my stay in Madras for the 14th Indian Catalysis Society National Symposium at Anna University, I heard several young researchers, who never worked at IIP nor directly associated with him, expressed their gratitude to Dr. Prasada Rao for help bringing financial support for their catalysis research. Late Dr. Prasada Rao told me that "all catalysis researchers in India are my friends". When introducing me for my lecture at IIP, he also thanked "Professor Song is a friend of India" (partly because several young researchers and graduate students from India have worked with me in our laboratory). In my opinion, it takes a great mind to be able to make such statements naturally and he has certainly devoted his energy and time to his country by his outstanding contributions in enhancing the research and development in Indian catalysis community.

The dedicated efforts and outstanding accomplishments of Dr. Prasada Rao have been recognized by many prestigious awards, such as the Kuloor Memorial Award in 1992; FICCI Award in 1993 by the then Prime Minister of India Mr. P.V. Narasimha Rao; Kamal Kumari National Science and Technology Award in 1995; KG Na

Gold Medal in 1996; Eminent Scientist Award by Catalysis Society of India in 1997; Om Prakash Bhasin Award in 1996; CHEMTECH Academic Award in 1998; and Fellowship of Science and Engineering Academies in India. As such, it should come as no surprise that Dr. Prasada Rao as a resource has been widely tapped by the government of India on India's highest bodies governing oil policy (Oil Industry Development Board), science policy (Society of the Council of Scientific and Industrial Research), education, and industry. In addition to his tireless efforts in leading IIP to become a global R&D organization, Dr. Prasada Rao has over 100 research papers, 25 patents and 3 books to his credit. He has served on the editorial board of Applied Catalysis journal, has represented India at the International Congress of Catalysis for the past 10 years and has served as President of the Catalysis Society of India.

Integral to Dr. Prasada Rao's achievements have been his wife, his son and his daughter. I happen to have had opportunities to know his son and his wife. Dr. Prasada Rao has always had a very busy schedule, traveled so much and worked in the train and in the car, but in the same time he has been a caring and loving father and husband. He cared about his family as well as the institute. I can see that from how his son, Uday Turaga (who currently works with me in our laboratory) admires his father.

Finally, I would like to congratulate Dr. Prasada Rao for his monumental achievements in research and development in Indian catalysis community and for his highly successful professional career and personal life, and I wish him continued success. I would also like to thank the Catalysis Society of India for the kind invitation to visit India and for the invitation to contribute this article.

THE CATALYSIS SOCIETY OF INDIA AND ITS ACTIVITIES TO FOSTER CATALYSIS RESEARCH

*Dr. S. Sivasanker**

The catalysis society of India (CSI) was founded in March 1973 at Banaras with Prof. S.K. Bhattacharyya as the president and Prof. J.C. Kuriacose as the Secretary. The society has already completed 25 years of existence. The society has been growing continuously and has a membership (Life) of more than 500 at present. The main mandates of the CSI are to encourage catalysis research in India, to organize professional meetings between the researchers to enhance mutual interactions and to encourage cooperation between the industry and the academia. Excellent articles on the founding and achievements of the society have been written by Dr. K.K. Bhattacharyya and Dr. N.M. Gupta in the 'Souvenir' of the 13th national Symposium on Catalysis. There is really not much that can be added by me to the above articles within a year. I will make a general presentation of the catalysis research scenario in India and the role played by the CSI in promoting catalysis research.

Growth of Catalysis Research in India

The number of life members in the catalysis society is an indirect measure of the catalysis research activity in the country. As already mentioned, this number is now atleast 500 compared to the 75 in 1974. At the time of the founding of the CSI, the major centres of research in catalysis were just a handful, the IITs at Madras and Kharagpur, PDIL at Sindhri, IIP Dehradun) and IPCL (Baroda). Catalysis research activity has spread to many more organizations during the past 25 years. The important research centres today are (based on the presence of atleast 10 life-members in CSI from the organization) are IIT (Madras), PDIL, IIP, IPCL, NCL (Pune), IICT (Hyderabad), CSMCRI (Bhavnagar), BARC (Mumbai), CFRI (Dhanbad) and RRL (Bhubaneshwar). The importance attached to catalysis research in these organizations is also evident from the fact that all of them have hosted either a catalysis symposium or a workshop during the last 25 years. Other important places of research in catalysis are RRL Tiruvananthpuram) which conducted a workshop recently, IISC (Bangalore), IOC (R&D), MRL (R&D), ACC (Thane) and HLL (Mumbai).

During the last two decades, the catalysis community in India has made significant strides both in applied and fundamental research. Many catalysts and processes have been developed and commercialized, notably by IIP, IPCL, NCL and ACC in petroleum refining and petrochemicals manufacture and by PDIL in fertilizers production. In basic research also, members of the society have made important discoveries in catalysis resulting in publications in prestigious journals such as Nature and Science. In catalysis education, whereas only the IITs and a few Universities were active during the seventies, today Ph.D. students can be found in nearly all the organizations mentioned. An interesting development in catalysis education is the introduction of a two year M.Tech. course in Industrial Catalysis at the Cochin University of Science and Technology recently.

An important activity of the CSI is the organization of national symposia and workshops on catalysis jointly with host organizations. In recent times, there have been so many foreigners participating in these meetings that they have virtually become international events. So far, the CSI and host organizations have jointly organized 14 National symposia and 6 workshops. These meetings have been enormous successes with about 300 to 500 participants. A large number of papers (at least 100) are presented and discussed with wide dissemination and exchange of ideas. Besides, meetings (short symposia) are also arranged by the local chapters of the society for various reasons, very often to honour a scientist at the time of his superannuation. All these meetings conducted under the auspices of the CSI have been important in the development of catalysis research in India.

Another important activity of the CSI is the publication of the 'Bulletin of the Catalysis Society of India' on a bimonthly basis. The bulletin has a readership of more than 550 persons in India (mostly Life and Corporate Members). Original research articles and reviews submitted by the CSI members are published along with news-briefs covering the activities of the individual members and zonal chapters and

abstracts of recent publications by its members. The bulletin acts as a window to look at the activities of the various research groups in India and is also a source of information on the recent happenings in catalysis in India and abroad.

The CSI has also been encouraging catalysis research through its awards, the 'Eminent Scientist Award', the 'Young Scientist Award' and the 'L.M. Yeddanapalli Award'. Awards are statements of appreciation of the work done by the individual, and encourage the person to achieve more.

The future of catalysis research in India

One of the objectives of the CSI is to encourage industry - academia interactions for mutually beneficial collaborative research. Though these interactions have definitely increased since the inception of the society, the level of collaboration is still not very high. Contrary to the trend in developed nations where most catalysis research in academic institutions is supported by the industries, in India, most of the funds come from government agencies such as the CSIR and DST which are not the users or direct beneficiaries of the research. This results in a large amount of research not of much relevance to the industry. Even the petroleum and petrochemical industries, who are the major users of catalytic processes, do not carry out much R&D work (except IPCL and IOC). Their support to external research is also rather small, which could partly be due to the lack of suitable research proposals (of interest to the industry) from the academia.

The opening up of the Indian market for global business has resulted in many partnerships between Indian and foreign organization. For example, a good amount of catalysis research carried out at NCL is in collaboration with multinationals. It should also be possible for the academic institutions in India to enter into collaborative research with foreign industries. Again, with the opening up of the Indian market for global business, catalysis research aimed at indigenization of existing catalysts and processes has lost relevance. The focus of future research should be towards globally competitive catalysts and processes which can be exported to other countries.

A predominant amount of catalysis research in India is centred around the characterization of catalysts and laboratory level catalytic reaction studies (of limited value). Less work is being done on the understanding of the preparation of catalysts. This has resulted in notably few novel Indian catalysts or catalytic materials (or even crystalline microporous materials which are being continually discovered outside India!).

In the area of catalyst/process development and commercialization, one bottleneck is the limited availability of engineering support by way of process and reactor design. Only a few organizations have the ability to carry out integrated research from laboratory level studies to process commercialization.

Worldwide, catalysis is now not only perceived as the route to economic benefits, but also as a means of saving raw materials and prevention of ecological damage. The development of green processes and pollution abatement catalysts has acquired importance at present.

Today, the most wasteful operations are carried out in the organic chemicals and pharmaceuticals industries. Many of the synthesis and reaction steps used in these industries are based on discoveries made many decades ago when environmental concerns were absent. The byproduct yields in many processes are 5 to 100 times that of the desired product due to poor product selectivities and the many steps involved. This results in economic penalties, waste of raw materials and environmental problems. It is believed that highly selective and friendly catalysis based organic transformations will become important in the fine chemical and pharmaceutical industries in the near future. Again, catalysis in the synthesis of chiral compounds is expected to grow rapidly. Other areas of importance are the heterogenization of many homogeneous catalysts in industrial practice, the immobilization of enzymes and synthesis of enzyme mimics. The last mentioned area assumes importance as enzymes are by the most efficient catalysts known, nature has taken millions of years to design them.

In the preceding pages, I briefly recounted the activities of the CSI, its growth through a symbiotic relationship with the catalysis researchers in India and the future trends in catalysis research in India and elsewhere. The catalysis society will continue its role as a go-between the researchers and encourage research through its many activities. With the changing economic scenario in India, catalysis research activities in India will also undergo many changes in objectives, focus and partnerships. I believe that the members of the CSI will overcome the challenges and continue to contribute to the growth of our Nation. One of the reasons for the continued success of the society has been the excellent cooperation of the

members which I am sure will continue in the future also. With such a large research activity in catalysis, it is time that we had a research journal in catalysis of international standard published in India. I hope that the catalysis bulletin will ultimately grow to be an international journal with the cooperation of the research workers. I also anticipate that the catalysis society's activities will become globalized by conducting international meetings and joint symposia with societies from other countries. The first step in this regard has already been taken; the present 'International Symposium on the Frontiers in Catalysis in the 21st Century' arranged by the Northern Chapter of the CSI in honour of Dr T S R Prasada Rao is probably the beginning.

IIP : A PREMIER R&D ORGANISATION

Dr. K.S. Jauhri*

A BRIEF HISTORY

The Indian Institute of Petroleum (IIP), one of the Constituent Laboratories of CSIR, was established in 1960 to provide R&D support to down stream sector of hydrocarbon industry. Located at Dehradun, in the picturesque Doon Valley, IIP received technical support from world famous Institut Francias du Petrole (IFP), France, in its formative years. R&D facilities received impetus from various organisations like UNDP, UNIDO, OADB, World Bank, CHT, etc. from time to time.

IIP, right from its inception, is dedicated to the service of hydrocarbon industry in providing scientific and technical support, development and transfer of technologies & products and, training of technical personnel from industry. In its almost four decades of existence, it has developed 62 technologies, licensed 71 plants to industry, published over 2000 papers and filed 145 patents. The cumulative capacity of the plants so far licensed is about 28 million tonnes per annum.

IIP has been accredited with ISO 9001 certificate since March 1998.

IIP's QUALITY POLICY

Indian Institute of Petroleum is committed to develop into an internationally reputed R & D centre of excellence for providing globally competitive technologies and services for Hydrocarbon and related industries. This will be achieved through total quality management and by anticipating and exceeding the expectations of customers through innovation, team work and commitment.

OBJECTIVES

- Develop innovative and frontier technologies and products.
- Maintain high level of scientific, technological, marketing and managerial competence.
- Excellence through team work, motivation and dedication.
- Provide customer satisfaction through meeting commitments on quality, cost and delivery schedule as per the contract.

OUR RESOURCES

Human . IIP is particularly gifted with dedicated, highly experienced and well qualified staff. It has 230 R&D Scientists/Engineers and 253 skilled Technical personnel amongst its total staff of 635. Nearly 30% of its R&D scientists and engineers are doctorate degree holders. IIP is recognised by prestigious academic institutions of the country, to conduct research leading to Doctorate degrees. IIP has so far produced 70 Ph.D's in different disciplines relevant to R&D activities of the Institute. In its endeavor to constantly upgrade the scientific & technical capabilities of its staff, IIP sends them abroad as well as organises training/ reorientation programmes for them within the country.

PROFILE OF SCIENTISTS & ENGINEERS

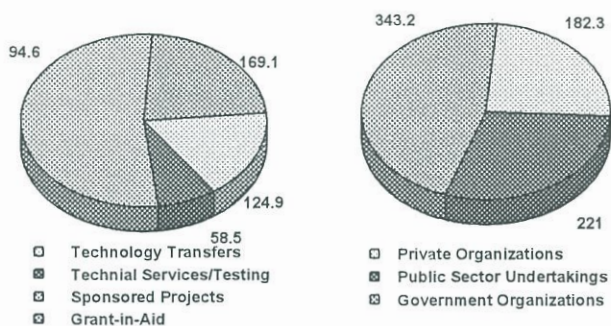

Library . With one of the best libraries in the field of petroleum processing and related areas in the country, IIP keeps its scientific brains updated on the latest developments in their fields. The current holdings of IIP library include 15,000 books, 15,000 bound volumes of journals and around 3000 miscellaneous publications. It regularly subscribes to nearly 140 periodicals, most of them being key publications in their areas.

Finance . IIP receives annual grants from Government of India through CSIR, its parent body. Apart from this source of funds, IIP also earns money from other sources through sponsored R&D programmes, technical services, and technology marketing. Such earnings are called Extra Budgetary Resources (EBR). The surplus money from EBR is accumulated in a kitty called Lab Reserve Fund (LRF). IIP's earnings from EBR have been constantly on the rise during the last 8-9 years. Today IIP earns nearly 80% of its CSIR grants from such sources. Our endeavor is to become self-supporting non-profit organisation in near future.

■ EBR (Rs in Lakhs)
■ Earnings in Percentage of CSIR Grant

MARKS OF GROWTH

Total : 747.1

Total : 747 .1

EBR Break-up 1997-98 : (Rs. in Lakhs)

Infrastructure . IIP has a very strong infrastructural support for its R&D activity, which is essential for such developmental work. It has a very comprehensive, sophisticated and state of art facilities for analysis, evaluation and testing of petroleum crude oil, its products and chemicals. IIP has, in recent years, embarked

upon major modernisation programmes to make its facilities most modern. State-of-art equipments worth Rs. 35 crores have been added within the last 3-4 years with the help of funds from OIDB, CHT, World Bank and our own internal resources. The Institute has well equipped workshops for design and fabrication of both metallic and glass equipments required for conducting its research work, and has its own captive power generation and water supply systems.

R&D AREAS AND ACHIEVEMENTS

The Institute is carrying out R&D work in the areas of Petroleum Refining, Catalysis, Chemicals & Petrochemicals, Application of Petroleum Products in IC Engines, Industrial and Domestic Combustion, Biotechnology and Analytical Sciences.

Petroleum Refining and Catalysis

IIP is engaged in R&D work in almost all major processes being used in a refinery, be these physical separations, catalytic conversions or thermal conversions.

Separation Technologies have been developed for separation of aromatics from various refinery streams like reformer and pyrolysis naphtha, raw cut hexane, kerosene and raw lube oils, using specific solvents. Our other solvent separation technologies include dewaxing, deoiling, deasphalting, and purification of ultrapure compounds through adsorptive separation processes. All these technologies have been licensed to industry.

Development of Catalytic Conversions Processes

include : (i) Catalytic reforming to produce lead-free, high octane gasoline as well as aromatics like benzene, toluene and xylenes, (ii) Hydrodesulphurisation of various refinery streams like naphtha, diesel and vacuum gas oil, (iii) Hydrocracking, (iv) FCC, (v) Sweetening of LPG, naphtha and kerosene, and (vi) Residue upgradation. Proprietary catalysts for all these processes either have been developed or are being developed. A noble metal catalyst and wash coat technology for catalytic converters have been developed. Latest developments include, conversions of light naphtha and NGL to LPG and aromatics.

Thermal Conversion Processes like visbreaking and delayed coking have been developed and are in use in Indian refineries. Almost all earlier oil visbreakers in the refineries have been revamped using our state-of-art soaker visbreaking technology.

Chemical Sciences

IIP is engaged in process development of bulk intermediates, additives and speciality chemicals. It also undertakes studies on electrochemistry and corrosion. Work is also being carried out on utilisation of renewable sources for energy and speciality chemicals.

Processes for **Bulk Intermediates** like adipic acid, isophthalic acid and purified terephthalic acid have been developed through novel ecofriendly synthesis routes. These technologies have evoked interests globally.

Processes for **Additives** like phenolic/amines types of antioxidants, wax crystal modifiers to improve cold flow properties of distillate fuels, multifunctional additives for lubricants, fuels and chemicals for enhanced oil recovery have been developed.

Processes for production of **Speciality Chemicals** like sulfolane and N-Methyl Pyrrolidinone (NMP) have been developed. An Indian company has become the third company in the world to produce sulfolane. Production of alcohols from n-paraffins is also in advance stage of development.

Basic engineering packages for all the above processes have been developed by the Institute. IIP also provides consultancy services for revamping of chemical plants.

Petroleum Products Application

IIP has one of the most comprehensive facilities in the country for applications of liquid and gaseous fuels and lubricants in IC engines. It has been rendering regular S & T support to the petroleum, automobile and related industries for evaluation and upgradation of their products.

Alternative Fuels. IIP has been carrying out extensive studies on partial replacement of gasoline and diesel by substitute fuels like alcohols (methanol and ethanol), natural gas,

LPG and biogas in automotive vehicles. Extensive field trials have been conducted to establish the technical feasibility of use of such alternate fuels. IIP is the first organization in the country to successfully convert a three wheeler vehicle into a natural-gas-operated vehicle.

Engine Emissions are also biggest sources of atmospheric pollution. IIP is very much alive to this serious menace. Extensive studies are being done in this area and S & T support is being given to industry. The laboratory is approved by the Ministry of Transport, Govt. of India for Type approval of vehicles and emission measurement equipment.

Tribology is the science of friction between moving surfaces. IIP is carrying out basic studies in this area and is also providing technical support to industry in the evaluation of their products and development of new products and techniques.

Regular assistance is being provided to Petroleum Conservation Research Association (PCRA) in evaluation of products for conservation of fuels and lubricants, and to Bureau of Indian Standards (BIS) in formulating standards for different petroleum products.

Industrial and Domestic Combustion

IIP has been highly successful in developing thermally efficient combustion appliances, both in industrial and domestic sectors, leading to significant conservation of fuels. Low air pressure (LAP) film burner developed by IIP, is being successfully commercially exploited and is in extensive use in various industries. Domestic appliances like LPG stoves, pressure and wick kerosene stoves developed by IIP have highest thermal efficiency among the products available in the Indian market. IIP also regularly provides its evaluation facilities in this area to industry. Design and development of a natural gas / LPG industrial burner is in its advance stage of completion. The Institute has provided technical support in the rural sector by improving performance of Gur making furnaces, which has resulted not only in a significant increase in the productivity but also reduced emission due to improved combustion of fuels in the furnace.

Biotechnology

The Institute has been engaged, since its inception in hydrocarbon transformations through biotechnology. The process for production of single cell proteins was developed upto pilot scale. Current researches in this area include microbial desludging of crude oil storage tank bottoms, production of microbial lipids and biodesulphurisation of diesel. Facilities for determination of biodegradability of lubricating oils have also been created to develop biodegradable lubes.

Analytical Sciences

IIP specializes in detailed analysis and evaluation of all kinds of crude oils, refinery products like fuels, waxes, lube oils, bitumens, asphalts, etc., feed stocks for secondary conversion processes, petrochemicals, catalysts, greases, additives, clays, etc. IIP is well equipped with state-of-the-art analytical equipments for this purpose. It caters to the analytical requirements of industries also.

Market Surveys & TEFRS

IIP conducts market demand surveys and prepares techno-economic feasibility reports for various products and processes as and when desired by a client. Several of such jobs lead to serious business propositions based on the outcome of such reports.

Training

As per the mandate given at the time of its creation, IIP conducts specialized training programmes for technical personnel from refineries, petrochemical plants, automotive industry and power plants. These advance courses are designed as per specific requirements. Faculty is mostly drawn from the Institute itself but experts in specific areas from other organisations are also invited to give lectures. IIP has so far trained nearly 3000 personnel from various industries.

IIP also trains young students doing their engineering, graduation and post-graduation studies in specific areas from various academic institutions.

RECOGNITIONS

The Institute and its Scientists have received many prestigious awards in recognition of excellence in various fields. IIP has a rare distinction of bagging eight CSIR Best Technology Awards in the past nine years of institution of such awards by CSIR. Two of its Scientists have bagged Best Young Scientist Award of CSIR. IIP has also received FICCI, ICMA & NRDC awards many times for its technologies. Individual scientists have the honour of being bestowed with prestigious awards like Om Prakash Bhasin Award, Kamal Kumari Foundation Award, Hari Om Prerit Shanti Swaroop Bhatnagar Award, FICCI Award, Catalysis Society of India Award, etc.

IIP is recognized by prestigious academic institutions in the country to conduct researches leading to award of Doctorate degrees.

OUR ASSOCIATES IN PROGRESS

From its inception IIP has followed a consortium approach for development of its technologies and providing the total engineering packages to its clients. Most of the R & D projects have industrial partners in development. Technologies have been developed in collaboration with organizations like EIL, IOCL, HPCL, BPCL, MRL, CRL, IPCL, GAIL, PCRA, NRDC, etc. Although administratively linked with CSIR, the Institute has very close links with Ministry of Petroleum & Natural Gas (MOPNG) and its several outfits like Oil Industry Development Board (OIDB), Centre for High Technology (CHT), Oil Coordination Committee (OCC) and Petroleum Conservation Research Association (PCRA). Major R&D projects are also being undertaken with able guidance and support of Scientific Advisory Committee of MOPNG.

We also have support from Department of Scientific & Industrial Research under its PATSER Programme, ICICI under their SPREAD programme, Technology Development Board, Department of Science and Technology, Ministry of Non Conventional Energy Sources, Ministry of Surface Transport, Ministry of Environment & Forest etc.

Globalization

With liberalization of Indian economy to integrate with global economy, IIP too has moved towards globalization of its technologies. With major thrust in last four years in this direction, we have been able to forge alliances with prestigious international companies in USA like Stone & Webster Engg. Corpn., Mobil Corporation, UOP, AMOCO and ABB-Lummus, for global marketing of our technologies, contract R&D or joint ventures. IIP is a partner in a consortium of IOCL, GAIL & AMOCO for production and marketing of dimethyl ether as a substitute fuel for power plants, diesel vehicles and domestic combustion appliances.

Our business association with Institut Francaise du Petrol (IFP), France is almost four decades old. We co-licence certain IFP technologies like catalytic reforming (both SR & CCR types), hydrodesulphurisation of various refinery streams, hydrogenation of pyrolysis gasoline in India. Twenty five commercial plants have been licensed jointly in India with a cumulative licensed capacity of 19 million tonnes per annum.

We also provide our technical services to companies like Exxon, Mitsubishi, Suzuki, Enron etc.

THE CAMPUS

Around 8 km away from Dehradun City at Haridwar Road, IIP is situated amongst 260 acres of lush green tea gardens. Its southern boundary touches the dense forests of Shivalik Hills while the front has a beautiful view of Himalayas. Its R & D and infrastructure facilities are housed in seven major buildings spread over nearly half of the Estate, while the other half has residential complex for its staff. It has its own medical facilities, water supply system, a central school, LPG supply agency, a cooperative store for sale of essential food items and a fair price shop. The guest house has 40 single and 20 double room suits to house trainees and guests. A community centre provides facilities for indoor games and library of staff club. It is also used as venue for various social functions of the community.

Our catalysts make hydroprocessing efficient

Application Areas

Diesel deep desulfurization and dearomatization

Distillate hydrotreaters

Hydrocracker feed pretreaters

FCC feed pretreaters

FCC gasoline hydrotreaters

Fixed-bed resid hydrotreaters

Naphtha hydrotreaters

Our process technology makes it more profitable

More and more refineries have turned to Topsøe for innovative and cost-effective hydroprocessing solutions.

We have created a family of outstanding hydrotreating catalysts that help cut costs by maintaining product quality for longer catalyst cycles. Moreover, our patented reactor internals distribute reactants so efficiently, some of our clients with a minor investment have actually doubled their cycle length. When your processing needs change, our specialists can help you revamp your units to achieve your immediate objectives without losing sight of longterm goals.

When the time finally comes to replace older units, new Performance Focused Hydrotreaters from Topsøe provide superior performance in a cost-effective installation.

By using Topsøe's technology and catalysts, we can also help you monitor unit performance and detect operational problems before they cause costly, premature shutdowns.

No matter whether you need a design for a diesel hydrotreater, aromatics saturation of gas oil, or a unit for processing resid, Topsøe can provide a custom-tailored solution that meets all your needs. Moreover, by licensing Topsøe technology, doors are opened to a wide range of technical services and support from scientists and engineers working with the most advanced tools in the world.

Naturally, we back up our commitment to performance with full process and catalyst guarantees. Why not let us show you how our Performance Focused approach can improve your profitability? We're just a phone call away.

Topsøe has been a leader in hydroprocessing technology for decades. Today, over 150 hydrotreaters around the globe rely on Topsøe catalysts and technology.

Working Together

Energizing India's Future with DME:

" A Clean Burning Fuel for the 21st Century "

What makes IPCL one of the world's leading chemical companies? The reasons are patently clear.

Today, the Indian Petrochemicals Corporation Limited (IPCL) is recognised as one of the foremost chemical companies in the world. The fact that it holds several patents in Europe, the USA and Japan - for a variety of catalysts, is just one of the factors contributing to this reputation.

Over the last quarter of a century we've invested intensively in building up strengths in research and development. Especially when it comes to catalysis, which is the core area of the chemical industry.

IPCL's focus on research has helped the company lead the market in the manufacture of a range of highly specialised products.

To take a few examples: we have developed catalysts for reforming, xylene isomerisation and

paraffin dehydrogenation. These are used for IPCL's applications and also marketed to other companies. A number of these catalysts have been patented all over the world.

In addition to catalysts, IPCL also manufactures a variety of molecular sieves and adsorbents. And we've recently embarked on a programme of mission-oriented technology development for manufacturing α - olefins.

With each of these products, our emphasis on home grown technologies has reduced our dependence on foreign suppliers. And our focus on using Kaizen to continuously upgrade the quality of both our technology and our products has helped make us what we are today - one of the biggest players in the global chemicals market.

Global Vision, Global Standards.

*M*ANY FORMS, ONE PURPOSE.

Your service. We make products that have become an integral part of your daily life. The gas in your kitchen, the fuel for your vehicle, the tar for your roads. The dyes for your clothes, the lubricants for your industry, and for the industries that provide you with your basic needs from food to clothing.

You are the one who makes it all worthwhile.

Improving the world we live in.

From water bottles to wind-up toys

From mugs to milk pouches

From jars to juicers

Reliance touches everybody's life.

From pipes to packaging

From gas-masks to garbage cans

From bottles to bathtubs

As the largest polymer manufacturer in the country, Reliance provides the raw materials for making almost every kind of plastic you've seen. This has enabled Reliance to touch the lives of millions for the better. Not just through the plastic products that it helps create but also because all Reliance plastics are recyclable and eco-friendly.

We Touch Your Life In More Ways Than You Realise...

Did you know that the clothes you wear, the paint with which you decorate your house, the medicines that cure you, might never have been but for the useful chemicals which go into their manufacture.

Vam Organic Chemicals Ltd. is making a major contribution in improving living standards by supplying high quality chemicals to a number of industries which bring you such products.

'VAM' has an extensive range of chemicals which includes Vinyl Acetate Monomer, Acetic Acid, Acetic Anhydride, Acetaldehyde, Industrial Alcohol, Carbon Dioxide and a wide range of polymers and copolymers like 'Vamulsion' and 'Vamtex' based on Vinyl Acetate, Polyvinyl Alcohol and other monomers.

The company also markets a wide range of 'VAMICOL' brand adhesives for use in the furniture, leather, rubber and other industries.

Products manufactured at 'VAM' find application in various industries like textiles, paints, man-made fibres, pharmaceuticals, plastics, dyestuff, soft drinks, packaging—the list can go on.

The most modern manufacturing facilities supported by strong research and development, strict quality control and prompt service make Vam Organic Chemicals Ltd. one of the most reliable sources of chemicals and polymers in the country today.

No wonder then, that we form an essential part of your life.

**For lube productivity
and quality,
we make the
catalysts
that make
the difference.**

Catalysts for high-quality lube production are not all alike.

Mobil lube catalysts are above competition, not only because they are precisely designed by our lube technologists, but also because they're manufactured at our catalyst plants in the US and Japan. In fact, we've been making our own catalysts for almost thirty years. We do it for our refineries. We'll do it for yours. It's all part of our innovative high-performance systems for lube manufacture.

to make a difference™

NATIONAL AEROSPACE LABORATORIES BANGALORE - 560 017

SURFACE ENGINEERING UNIT

The Surface Engineering Unit (SEU) of the National Aerospace Laboratories has a proven track record of developing economically viable surface modification technologies in the area of aeronautics, space, electronics energy and engineering. Several of these have been successfully commercialised. Some of the important contributions of SEU are highlighted below as illustration of the expertise available

- ❖ Development of passive radiative cooler for the very high resolution radiometer (VHRR) for INSAT II class of satellites
- ❖ Development of the technology of heavy nickel plating of metal seal discs for the heavy water circuit of the 230 MW type of nuclear reactor for power generation
- ❖ Development of solar selective black chromium coating (NALSUN) for solar thermal applications for harnessing solar energy
- ❖ Development of foil type strain gauges and the fabrication of metal bellows
- ❖ An electrochemical milling machine for the fabrication of integrally bladed wheel for the diesel loco turbo charger
- ❖ Development of technologies for diamond coatings for cutting tools
- ❖ Technologies for silver plating of mux-demux filter and gold plating of stainless steel push rods for pressure transducer for bonding applications
- ❖ Electrochemical Instruments for trace analysis, potentiostats, galvanostats and corrosion rate monitors

MRL – Poised for the change and challenges of time

Over the years ...

MRL has demonstrated its ability to change with the demands of the time.

From 2.5 MMTPA refining capacity to process 7.0 MMTPA of crude oil at 2 locations - Manali near Chennai and Panangudi near Nagapattinam, contributing to 12% of nation's refining capacity...

From refining just crude, to manufacturing a whole range of Petrochemical feedstocks, serving a host of downstream industries ...

An impressive performance

Thanks to the dedicated team of employees, MRL has excelled itself in its performance in 1997-98 with

- All-time high crude processing of 7.521 MMT
- All-time high turnover of Rs.2720 crores
- All-time high profit after tax of Rs.129 crores
- Highest ever dividend declared 27.5%.

The future is bright

MRL has on the anvil projects worth Rs.3,500 crores, which include a 3 MMTPA refinery expansion at Manali, a 500 MW Power Project in the joint venture at Manali, Jetty facilities to augment crude supply at Nagapattinam and also a mega-refining project in the joint venture. MRL is confident of funding these projects through significant internal accruals, and external borrowings.

The foray into the millennium is going to be dominated by a knowledge driven world, where knowledge and skills will be Power. MRL will focus on Technology Upgradation and Knowledge based training to properly equip its very young workforce to meet the challenges ahead.

Madras Refineries Limited

552, Anna Salai, Teynampet, Chennai 600 018.

Moving into the next millennium with confidence

Engineers India Limited – A dependable source of design and engineering services

Engineers India Ltd. is the leading engineering organisation in India serving various segments of the process industry. It has vast capabilities for setting up Petroleum Refinery, Pipelines, Oil & Gas processing, Petrochemicals, Offshore Platforms, Ports & Terminals, Fertilizers, Chemicals, Power and Metallurgical projects.

EIL helps the client in conceptualising the project, selecting environment-friendly technologies, carrying out feasibility studies and Environment Impact Assessment studies besides carrying out Process Design, Detailed Engineering, Procurement, Construction Management and Plant Start up & Commissioning. EIL also provides services for Heat & Mass Transfer equipment, Materials Selection and Maintenance, Energy Conservation, Advanced Control & Optimisation and Risk Analysis of process plants.

EIL has its own technologies for several non-licensed refinery units, gas processing units, aromatics extraction and fractionation etc besides well equipped Research & Development facilities.

Engineers India has one of the most diversely skilled engineering work force in this part of the world with over five million manhours available annually in its Design offices alongwith about ten thousand man months of Construction Management services per annum.

Engineers India Ltd. is the ideal choice for your next project in India or Abroad.

CSMCRI, BHAVNAGAR

Our Achievements and
Specialisation lie in

Salt, Marine & Inorganic Chemicals

Offer Technologies for
salt, bromine, calcium silicate, silica, zeolite and adsorbents

Membrane Science

Offer technologies for
**reverse osmosis and electro dialysis plants for desalination,
separation, ultrafiltration, removal of undesired impurities, etc.**

Oceanic Vegetation
(Marine Algae)

Offer technologies for
**alginates, agar-agar, carageenan & cultivation and harvesting
of sargassum, gracilaria, Gelidiella and Entromorpha**

Wasteland Development

Cultivation package for
Jojoba, Jetropha, Salvadoria, Atriplex

Above areas are supported by sophisticated instruments facilities, library and patent search facilities and engineering studies on bench scale. We welcome assignments in the above areas on consultancy/ sponsorship basis.

High Pressure Multiphase Catalytic Reactors

The best customised solutions with sophisticated pneumatics and instrumentation has even more to offer.

Total Engineering Support

Chemito has always strived to provide quality products, solution systems, after sales service and more, for over three decades.

This consistency in meeting the most exacting standards of the chemist, has made the company a leader in manufacturing and marketing analytical solution systems in India with a widespread user base in the field of chromatography, spectrophotometry and laboratory instruments.

Keeping in mind the same pursuits, Chemito offers a wide range of Catalytic Reactors for various applications in Catalysis testing and evaluation. These reactors are engineered, while understanding the needs of today's scientists, to suit most applications carried out in the laboratory.

Types of Reactors offered by Chemito

- Batch Reactors
- Catastest and continuous reactors
- Micro-Reactors for Kinetic studies
- Micro activity test
- Steaming unit
- Other Custom designed system

The standard features of Chemito HPCR

- Heated enclosures for effective vapourization of the Reactants
- Single or Dual Gas and Liquid Reactants Facility
- Mixing Zones
- Sophisticated Pneumatics and Instrumentation
- Modular Designing
- Customised Solutions available
- PC based operation

We are committed to build a better habitat a better nation a better future for one and all

IndianOil R&D Centre Adds Another Feather In Its Cap.

After the prestigious ISO-9001, it has now been accredited with prestigious ISO-14001 for its Environment Management System (EMS).

IndianOil's Research & Development Centre became the first R&D unit of the country's Petroleum Industry to get ISO-14001, when it was accredited with the prestigious certificate in February for its Environment Management System (EMS).

Established in 1972, the R&D Centre is committed to pollution control & environmental improvement. Working towards this goal, it has focussed its attention on developing environmentally safe products and processes. Besides, conservation of natural resources and effective waste management have been its other high-priority areas.

Research is a never-ending process especially in developing energy-efficient biodegradable lubricants and state-of-the-art refining processes at R&D Centre. This has largely contributed towards the development of globally competitive technologies. *SERVO* - IndianOil's world class lubricants reflect the capability of its R&D Centre to constantly innovate and upgrade products for any application.

Backed by its strong R&D Centre, IndianOil - the nation's only Fortune 'GLOBAL 500' company - continues to reach new heights of excellence and customer satisfaction.

IndianOil

Vision Beyond Tomorrow

NEW TECHNOLOGIES AND SERVICES
FROM

INDIAN INSTITUTE OF CHEMICAL TECHNOLOGY (IICT)

IICT is fully equipped with latest facilities to meet the emerging technological challenges of R&D. With over 600 highly qualified and professionally competent scientists and technical staff, excellent R&D facilities, well equipped pilot plants for scale up studies and expertise in design & engineering of commercial plants, IICT is known both nationally and internationally for its contributions in basic as well as its applied research in chemical sciences.

The institute can offer specialised engineering services in following areas

- ❖ *Process Technology Development and basic/design engineering*
- ❖ *Reaction engineering of heterogenous and homogenous catalysed reaction systems*
- ❖ *Thermochemical investigations of hazardous reactions*
- ❖ *Computer assisted design of pollution control facilities*
- ❖ *Training in computer aided studies and modelling / simulation*

Activities of HUMAN RESOURCE DEVELOPMENT (HRD) GROUP

The HRD Group at CSIR has been contributing significantly to the development of highly qualified S&T manpower at the national level. It also provides financial assistance to promote research work in the emerging areas of science and technology. The activities of the Group comprise (a) selection of Junior Research Fellows (JRF) through National Eligibility Test (NET), (b) selection of Senior Research Fellows (SRF) and Research Associates (RA) and awarding the fellowship, (c) selection of Senior Research Associates (SRA), (d) funding the Extramural Research (EMR) schemes at the universities / R&D organisations, (e) granting of visiting associateship, symposium grants and travel grants, (f) award of Shanti Swarup Bhatnagar Prizes and Young Scientist Awards, and (g) conducting training programmes.

Research Fellowships/Associateships

NET examinations are held twice a year for selection and award of JRFs. Applications are invited, twice a year, for selection of SRF and RAs through personal interviews.

Senior Research Associateship (Under Scientists Pool Scheme)

The Scientists Pool Scheme was constituted in 1958 to support highly qualified Indian scientific & technical personnel trained in India or abroad for temporary placement.

Extramural Research Schemes and Special Support Programmes

CSIR provides research grants to scientists / faculty members in the Universities with the objective of improving the overall scientific and engineering research in the country.

CSIR laboratories are encouraged to foster collaboration with university departments for carrying out high level research. While the scientific investigations are taken up at the universities, the CSIR laboratories undertake applied and development part of the work and industries are co-opted to help in providing the total technologies developed and in their commercialisation.

Financial assistance are provided to superannuated outstanding scientists under the Emeritus Scientists (ES) scheme to enable them to pursue R&D and / or write books / monographs.

Visiting Associateship Scheme enables guest scientists from outside CSIR to make use of the advanced R&D facilities available in the CSIR set up.

Travel grant is provided to young researchers for presenting papers at the International Conferences held abroad. Grants are also given to scientific societies / institutes / departments for organising National / International Conferences / Symposia / Workshops, etc.

Shanti Swarup Bhatnagar Prizes

The Shanti Swarup Bhatnagar (SSB) Prizes for science and technology, instituted in 1957, are awarded annually to scientists, who are not more than 45 years of age, for outstanding research work done primarily in India during the last five years. The SSB Prize carries a cash award of Rs. 1.00 lakh, a citation and a plaque.

Young Scientist Awards

The CSIR Young Scientist (YS) Awards, instituted in 1987, given annually to scientists working in CSIR system to promote excellence in various fields of science and technology. These awards are presented to the recipients on 26 September, the CSIR Foundation Day. On this day, the CSIR Foundation Day Lecture is delivered by an eminent scientist.

Intramural Training Programmes

In order to enhance the managerial skills of the senior scientists, training programmes on 'Management of R&D' are arranged at the Administrative Staff College of India, Hyderabad.

GLOBAL CAPABILITY IN YOUR REGION

Criterion hydrotreating catalyst manufactured locally in Singapore will be available to refiners throughout the Asia/Pacific Rim region beginning in mid-1996.

When you use Criterion's catalysts, you have full local access to the worldwide research, manufacturing and technical service capability of Criterion—the catalyst innovator totally committed to customer satisfaction. In the Asia/Pacific Rim region, that access is through the office Criterion has established in Singapore, allowing faster response to our customers.

The staff there will work with you to ensure that they fully understand your refining needs. This understanding will enable them to help maximize the efficiency of your process through selection of the best catalyst for the job and optimization of its use in your units.

Find out about the global sales and technical service capability available in your region. Contact your local Criterion representative or the Criterion sales office listed below.

**DID
YOU
KNOW?**

Behind the successful operation of millions of vehicles on Indian roads, there is one common name...

LUBRIZOL INDIA LIMITED

- A pioneer in the manufacturing of speciality chemical additives which dramatically enhance the performance of lubricants and fuels.
- A successful joint venture between the Government of India and the Lubrizol Corporation USA, who are world leaders in petroleum additive technology.
- One of the very few companies outside USA and Europe which has the capability to develop and manufacture speciality chemical additives for virtually every lubricant and fuel application.

- A company responsive to the country's needs. Earns precious foreign exchange by exporting its high technology products to developed markets such as Europe etc... Constantly develops and commercialises import substitute products.
- The credits go on... But the quest for excellence remains undiminished.

LUBRIZOL INDIA LIMITED

A Government of India Company
Regd. Office: Leo House, 4th Floor,
88-C, Old Prabhadevi Rd., Bombay-400 025.

A PIONEER...NOW...AND FOREVER

Be it a girl or a boy! Both bring a family joy.

 Capt R J Simon

CONVENER

Mr V K Kapoor

CO-CONVENER

Dr K Narsimha

TREASURER

Mr N Ray

SYMPOSIUM SECRETARIAT

Dr A Datta,	Convener
Mr V K Kapoor,	Member
Dr K Narsimha	"
Mr N Ray	"
Mr K K Kaul	"
Mr Pritam Singh	"
Mr Muninder Pal Singh	"
Mr Ashok Punetha	"
Mr Vikram Singh Rawat	"

EXHIBITION, MEMENTO AND SYMPOSIUM RELATED MATERIAL

Dr S N Sharma,	Convener
Mr N N Kulshrestha,	Member
Dr K M Agarwal	"
Mr N R Gupta	"
Mr S V K Dilawar	"
Mr P Vijayanand	"

FINANCE

Mr S S Sachdeva	Convener
Mr N Ray	Treasurer
Mr S K Gupta	Member
Dr J K Gupta	"
Mr A Muthukrishnan	"
Mr Ram Singh	"

SPONSORSHIP

Dr K S Jauhri	Convener
Mr Prem Singh (SPO)	Member
Mr P K Jain	"
Mr S K Malhotra	"
Dr Prashant Kumar	"
Mr Mool Chand	"

CULTURAL PROGRAM

Dr V S Saini	Convener
Mr S S Negi	Member
Mr Nishan Singh	"
Mr T Chiranjeevi	"

PRESS, PUBLICITY, ACCOMMODATION AND TRANSPORT

Mr P V Dogra	Convener
Mr S M Dhir	Member
Dr Basant Kumar	"
Dr A K Jain	"
Mr A K Saxena	"
Dr S Tripathi	"
Mr V K Chibber	"
Mr B N Srinivas	"
Mr Hakim Singh	"
Mr G Kothari	"
Mr Chettar Singh	"
Mr Kaman Singh	"
Mr Sandeep Kr. Saxena	"

COMMITTEES

MEDICARE

Dr Ashok Kumar	Convener
Mr H K Sahi	Member
Mr Trilok Singh	"
Miss Sunita Rani	"

CATERING

Mr S K Chibber	Convener
Mr D C Pandey	Member
Mr R K Chauhan	"
Mr Babulal	"
Mr G C Kothari	"
Mr R K Joshi	"
Mr Anand Singh	"

RECEPTION AND REGISTRATION

Dr A K Saxena	Convener
Mr S M Nanoti	Member
Mr G Das	"
Mr Jasvinder Singh	"
Mr V S Kukreti	"
Mr M S Rana	"
Miss Palki	"
Miss Shilpa	"
Miss Kuljeet	"
Mr S Kothari	"

SPOUSES PROGRAM

Dr Asha Masohan	Convener
Dr Lalita Bakaya	Member
Miss Anjali Sinha	"
Miss Bobby Kuchhal	"

SITE PREPARATION

Mr R N Roy	Convener
Mr V K Verma	Member
Mr H R Aggarwal	"
Mr J K Kumar	"
Mr V S Dangwal	"
Mr C N Bhargava	"

SECURITY

Capt. R J Simon	Convener
Mr A Muthukrishnan	Member

INAUGURATION

Dr D C Madhwal	Convener
Mr Nishan Singh	Member
Mr Govind Ballabh	"
Mr C S Sharma	"
Mr Manoj Kumar	"
Dr L D Sharma	"

TECHNICAL SESSIONS

Dr V K Bhatia	Convener
Dr M Saxena	Member
Mr P G Khanwalkar	"
Mr Nishan Singh	"
Dr Lalji Dixit	"
Mr Ashok K Punetha	"

COMPILATION AND PUBLICATION OF FELICITATION VOLUME AND CSI BULLETIN

Dr G Muralidhar	Convener
Dr N Viswanadham	Member
Dr S Tripathi	"
Mr M S Rana	"
Dr T Venkateshwar Rao	"

FELICITATION

Dr M O Garg	Convener
Mr R L Sharma	Member
Dr Y K Kuchhal	"
Mr D S Rawat	"
Mr Guru Prasad	"
Mr C R Srivastava	"

SOUVENIR

Mr K K Gandhi	Convener
Dr O S Tyagi	Member
Mr S K Malhotra	"
Dr V V D N Prasad	"
Mr Jassu Sharma	"

EXCURSION

Dr Uma Shanker	Convener
Mr V P Sharma	Member
Mr Guru Prasad	"
Mr G S Pawar	"
Mr J K Dimri	"

भारतीय पेट्रोलियम संस्थान

देहरादून - 248 005

**INDIAN INSTITUTE OF PETROLEUM
DEHRADUN 248 005 INDIA**

AIMS & OBJECTIVES:

The Indian Institute of Petroleum was established in September 1960 and started functioning at Dehradun from April 1963. The mandates of the institute are:

- Development of Processes for Petroleum Refining
- Assistance to Refineries in Absorption, Adoption, Selection of Technologies and Optimisation of Unit Operations
- Evaluation of Products for Market Development
- Technical Services including Crude Evaluation
- R&D work on Utilisation of Crude Petroleum, its Products, Natural Gas and Petrochemicals
- Impart Training to Personnel of Oil and Petrochemical Industry
- Assistance to Bureau of Indian Standards (BIS) in Formulating Standards for Petroleum Products
- Conduct Technoeconomic Feasibility Studies & Market Demand Surveys of Petroleum Products

PROCESSES AND PRODUCTS DEVELOPED

The following processes/products have been developed and licensed to the industry:

PROCESSES

- Computer data based of 30 indigenous & 140 imported crudes
- Various Speciality chemicals & Petrochemical Additives DBPC, PTBP, Sulpholane & high Temperature antioxidants
- NGL/Light Naphtha to LPG and aromatics
- Selective Hydrogenation of Pyrolysis gasoline (IIP-IFP)
- Lube base stocks with NMP extraction (IIP-EIL-MRL)
- Gas oil & naphtha hydrodesulphurisation (IIP-IFP)
- Petroleum based electrode pitches (IIP-GIL)
- Re-refining of used crankcase lubricating oil
- Food grade hexane production (IIP-EIL)
- Visbreaking & delayed coking (IIP-EIL)
- Bimetallic reforming catalysts (IIP-IPCL)
- Dearomatisation of naphtha (IIP-EIL)
- Hydrotreatment processes (IIP-EIL)
- Wax deoiling & dewaxing (IIP-EIL)
- Propane deasphalting (IIP-EIL)
- Aromatics extraction (IIP-EIL)

PRODUCTS

- Retrofit kit for dual-fuel operation
- Hot rolling oil, white oils, greases, 2 stroke engine oils
- Alcohol fuels and CNG utilisation in IC engines
- Indigenous smoke meter
- Improved wick stove, LPG stove, hurricane lantern
- Low air pressure film burner

Gram : PETRINST

Hit your target every time with IFP, the world's leader in olefin processing.

Over 24,000,000 hours of cumulative industrial operation.
Over 30 centuries of olefin processing.
That's experience !

Olefin Purification: Hydrogenation of cracked cuts for the production of unsaturated products, such as: propylene, butadiène, normal butenes, 1-butene, 2-butenes, pentenes, stabilized pygas, olefin and sulfur free aromatics, arsenic and COS free propylene. Selective hydrogenation of FCC cuts: butenes, isoamylene, FCC gasoline; *Arofining* reformaté purification for aromatics production.

Olefin Transformation: *Alphabutol* 1-butene from ethylene, *Dimersol-E* gasoline from FCC ethylene and propylene,

Dimersol-G hexenes by propylene dimerization, *Dimersol-X* octenes by butene dimerization, *Polyfining* C₄ raffinate-2 purification for 1-butene production, *Polynaphta* gasoline from C₄ olefin oligomerization, *Selectopol* isobutene removal from n-butenes.

And the innovation continues: *AlphaSelect* maximized production of C₄ to C₁₀ alpha-olefins from ethylene, *Difasol* boosting octenes yield associated with *Dimersol-X*, *Isopure* high purity isobutene from isobutene containing C₄ cuts, *Meta-4* propylene production by metathesis.

IFP - THE olefins expert.

Arofining, Alphabutol, Dimersol, Polyfining, Polynaphta, Selectopol, AlphaSelect, Difasol, Isopure and Meta-4 are trademarks of IFP. The following processes were co-developed with partners: Alphabutol (SABIC), Isopure (Bayer AG), Meta-4 (CPC Taiwan).

IFP Industrial Division, 1 & 4, avenue de Bois-Préau, 92852 Rueil-Malmaison, France
